

Pontian

Intelligence that
works inside the
company.

COMPANY OVERVIEW

What Pontian does, for whom, and why now.

SEPTEMBER 2026

Orlando · São Paulo

The AI that makes a difference is the one that knows your company. Pontian builds that layer.

EXHIBIT 1

SITUATION

AI models became good, cheap and identical for everyone. Having access to them stopped being an advantage.

COMPLICATION

What sets a company apart is what only it knows. That knowledge sits in folders, email, meeting minutes and the heads of veterans, with no owner and no version.

QUESTION

How do you turn that knowledge into operating capability, with control over who sees what, while the current systems stay in place?

ANSWER

A layer the company owns: one place for the truth, answers with sources, deadlines and team on one screen, automations a person approves. First department in production within six months, measured against a baseline.

In three years the value of AI moved out of the model and into each company's own context.

EXHIBIT 2

2023

Chat

A general model answers general questions. Impressive for a week. It knows nothing about your company and forgets everything when the tab closes.

2025

Copilots

Every tool got an assistant. One in email, one in the spreadsheet, one more in CAD. Each helps with one task. None of them sees the whole.

2026

Operating layer

The model became a commodity. What counts is your company's own knowledge, tied to daily work, under your rules. That is where Pontian works.

Models will keep getting better and cheaper. The edge becomes what only your company knows.

Source: Pontian market reading, 2023 to 2026.

Adoption is still shallow: almost half the sector's firms use no AI, and under 1% use it across the organization.

EXHIBIT 3 Construction and built-environment firms, % of respondents by stage of use

The window to get ahead is still open in almost every sector.

Source: RICS, Artificial Intelligence in Construction Report, 2025. Approximate values.

The leaders follow one pattern: controlled data, a focused assistant, citations and human review.

EXHIBIT 4 Figures are self-reported by the firms. They are no forecast for yours.

FIRM	PROFILE	WHAT THEY BUILT
AECOM	Engineering and infrastructure, global	Internal knowledge assistant (Oscar), an AI policy, and separate categories for general assistants, operational automation, engineering AI and agents. AECOM Annual Report 2025
Mott MacDonald	Engineering, about 20,000 people	EMMA assistant opened to the whole firm after years of work on current, consistent, connected data. REALM requirements tool with expert review, 35% to 45% faster in a pilot of 4,000 requirements. Mott MacDonald Insights, 2025
Dunaway	Civil engineering, United States	Atlas assistant for regulatory research, with citations, confidence levels and escalation to an expert. Firm and Microsoft report 90% less research time. Microsoft Customer Stories, 2025

None of them bought an autonomous agent. All of them built a controlled base and put a person at the end of the flow.

Source: Annual reports and publications by the firms themselves, 2025.

The company's knowledge exists. It sits in six places that do not talk to each other.

Folders, email, meeting minutes, spreadsheets, systems, and the head of whoever has been there twenty years. Every new project starts the search over.

EXHIBIT 5

Every answer arrives with the document it came from. No permission, no view.

Pontian builds a five-part layer on top of the systems the company already uses.

EXHIBIT 6

01 One company truth

Documents, decisions and rules in one place, with the current version and its history. What got replaced is marked as replaced.

Design standard v12	in force since 03/2026	replaces v11
---------------------	------------------------	--------------

02 Answers with sources

Anyone asks in plain language. The answer comes with the passage and the document. When the evidence does not exist, the system says it does not know.

What is the approval lead time?	15 business days
Contract 0421, clause 4.2	

03 Deadlines and team

Schedules and allocation on one screen. Deadline collisions by area, load per person, who has room.

Week 38	Electrical: 3 deliveries	Ana: 46h of 40h
---------	--------------------------	-----------------

04 Automations with approval

Meeting minutes, project kickoff summaries, weekly reports. The system drafts, a person approves, everything is logged.

Minutes 007 ready	awaiting approval	Ana P.
-------------------	-------------------	--------

05 Permissions everywhere

Each person sees what their role allows. One client never mixes with another. Every change has an author, a date, and can be undone.

Project A	Project B	no cross access
-----------	-----------	-----------------

Every answer passes through five stages before it reaches a person, and every stage leaves a record.

EXHIBIT 7

- 01

Approved sources

Folders, Autodesk Docs, SharePoint, project mailboxes, meeting transcripts. Only what the company authorized.
- 02

Sync with permissions

Files, versions and permissions come in as they are at the source. Whoever cannot see it there cannot see it here.
- 03

Knowledge base

Current version and history. What got replaced is marked, with date and author.
- 04

Answer, dashboard or report

The person asks in plain language and receives the passage and the document. Without evidence, the system says it does not know.
- 05

Approval and record

Material changes go through a named person. Every change has an author, a date, and can be undone.

PONTIAN

12:04

What is the approval lead time for the executive design under this contract?

Fifteen business days from formal delivery, extendable once with written notice.

■

Contract 0421 · clause 4.2 · version in force since 03/2026

2 SOURCES · 1.8 S · APPROVED BY ANA P. ON 09/12

The model is replaceable. The base, the permissions and the history stay with the company.

The value shows up in four routines that eat time today without anyone measuring them.

EXHIBIT 8

	TODAY	WITH THE LAYER
Starting a new project	Weeks of digging through folders and asking whoever remembers.	A summary ready on day one, with sources.
The same question, again	Someone answers it for the tenth time.	Answered once. Kept for the next person.
A decision made in a meeting	Stays in the recording. Nobody finds it later.	Becomes minutes in the company's template and enters the record.
Who is overloaded	Found out after the deadline passed.	Visible that week, per person and per project.

Source: Measured against a baseline taken in the first month. No number is promised before measuring.

The same design serves any sector where what the team knows is worth more than the software it uses.

EXHIBIT 9

Engineering and construction WHAT GETS LOST TODAY Fifteen disciplines, one client, eight projects at once. The account's memory lives in veterans. WHAT CHANGES Each new project starts knowing what the last one learned.	Heavy infrastructure WHAT GETS LOST TODAY Long jobs, rotating crews, standards that change midway. WHAT CHANGES The current standard and the lesson from the last job arrive together, when the question is asked.	Real estate development WHAT GETS LOST TODAY Approvals, contracts and phases in systems that do not talk. Every development reinvents the process. WHAT CHANGES The approved process becomes the standard. What ran late last time is visible next time.
Agribusiness WHAT GETS LOST TODAY Harvest, logistics, credit and weather in separate spreadsheets, each farm its own way. WHAT CHANGES One read per farm per week, with the origin of every number.	Field services WHAT GETS LOST TODAY The owner dispatches from the truck. What he knows is written nowhere. WHAT CHANGES Quote, schedule and billing in one flow. The owner gets out of the truck.	Education WHAT GETS LOST TODAY Content scattered across rented platforms. The student does not know where they stand. WHAT CHANGES One platform of their own, from free to private lessons.

Six steps, always in the same order: observe before connecting, measure before expanding.

EXHIBIT 10

01 **Observe**

Two weeks inside the operation. Meetings by area, screen recordings of real work, a measured baseline.

03 **Deploy**

A first version in use within weeks, with a small group. Two-week sprints, a demo at the end of each.

05 **Expand**

From the pilot group to the whole department, then to the rest of the company once the numbers justify it.

02 **Connect**

Read-only access to the systems already in place. Nothing gets replaced, and nobody types the same thing twice.

04 **Measure**

Questions answered with sources, time to start a project, corrections made. All against the baseline.

06 **Compound**

Every correction becomes permanent knowledge. The system improves with each project, and the company keeps all of it.

01 Six months to the first account in production.

02 One owner on the client side.

03 After that, Pontian runs and maintains it.

Within six months the first department is in production and the corporate base is ready to expand.

EXHIBIT 11

PILOT		DEPARTMENT		COMPANY	
MONTH 1 Discovery	MONTH 2 First version	MONTH 3 Connections	MONTH 4 Teams	MONTH 5 Company	MONTH 6 Production
▪ Meetings by area and recordings of real work ▪ Map of sources and permissions ▪ Architecture and measured baseline	▪ Pilot group using the system ▪ Answers with sources ▪ Knowledge approval flow	▪ Sources connected read-only ▪ Automatic sync ▪ Employee workspace	▪ Rollout to the department's teams ▪ Leadership view: deadlines and team ▪ First automatic reports	▪ Corporate base: standards, manuals, lessons ▪ Automations with approval ▪ Structure for the other departments	▪ Security and leakage tests ▪ Training and runbooks ▪ Production acceptance

Source: Reference sequence. Exact dates come out of month 1 discovery.

Five controls keep authority with people and make the system auditable.

EXHIBIT 12

01 Permissions by account, project and role One client never mixes with another.		ACCEPTANCE TARGETS	
02 Answer with source, or abstain Without evidence, the system says it does not know.		100%	of material answers with source, scope and version
03 Human approval for material changes The system proposes. A named person approves.		≥ 95%	citation-to-document accuracy
04 Technical authority stays with professionals Engineering, legal, safety and the client decide. The AI drafts.		≥ 90%	of claims supported by the evidence
05 Permanent testing Leakage, citation accuracy and availability, measured every month.		0	leaks between projects or clients
		0	external actions without approval
		99%	monthly availability
		≤ 15 min	for a source change to show up

Source: Targets used in Pontian programs. Final thresholds set with the client after the baseline.

Engagements are priced on measured outcomes: a fixed program price, released stage by stage.

EXHIBIT 13

01 Fixed program price Set before the start, with the scope in writing.	02 Monthly measurement Each month has a named outcome. Payment follows acceptance.
03 Third-party costs separate Models, hosting and licenses paid at cost, with an estimate up front.	04 Operation after the program A monthly fee to run, monitor and improve. Cancel with 30 days' notice.
05 Data and knowledge belong to the client Full export at any time, in open formats.	06 Continuity guaranteed Option to license the instance, plus a continuity package in escrow.

Source: Standard structure. Amounts depend on the scope defined in discovery.

A small team between Orlando and São Paulo, with specialists per project.

EXHIBIT 14

Gustavo Campos	Relationships and engagement	Runs the client conversation from the first coffee to the contract.	ORLANDO
Shouqi Han	Technical lead	Designs and builds the system. Accountable for what goes to production.	ORLANDO
Scott Robinson	Applied AI and engineering	Georgia Tech. Models, evaluation and answer quality.	ATLANTA
Eduardo Izawa Maciel	Software engineering	Inteli. Integrations and on-site presence.	SÃO PAULO
Felipe Dreifus	Software engineering	Inteli. Rollout, workflow recording and training.	SÃO PAULO

BIM, data and security specialists join per project when the work calls for it.

Let's talk.

Thirty minutes on where your company's knowledge sits today and what could be done with it.
